OF
UNION OIL DEVELOPMENT CORPORATION
KERN COUNTY LAND COMPANY
AND
AUSTRALIAN OIL AND GAS CORPORATION LIMITED

Issued under the Authority of the Hon. David Fairbairn
Minister for National Development
1965
Published by the Bureau of Mineral Resources, Geology and Geophysics
Canberra A.C.T.
FOREWORD

Under the Petroleum Search Subsidy Act 1959-1961, agreements relating to subsidized operations provide that the information obtained may be published by the Commonwealth Government six months after the completion of field work.

The growth of the exploration effort has greatly increased the number of subsidized projects and this increase has led to delays in publishing the results of operations.

The detailed results of subsidized operations may be examined at the offices of the Bureau of Mineral Resources in Canberra and Melbourne (after the agreed period) and copies of the reports may be purchased.

In order to make the main results of operations available early, short summaries are being prepared for publication. These will be grouped by area and date of completion as far as practicable. Drilling projects and geophysical projects will be grouped separately. In due course, full reports will be published concerning those operations which have produced the more important new data.

This Publication contains summaries of data and results of two drilling operations undertaken in the Surat Basin, Queensland: Union-Kern-A,O,G. Middle Creek No. 1, and Union-Kern-A,O,G. Southwood No. 1. The information has been abstracted by the Petroleum Exploration Branch of the Bureau of Mineral Resources from well completion reports furnished by Union Oil Development Corporation.

SUMMARY OF DATA AND RESULTS*

SUMMARY

Union-Kern-A.O.G. Middle Creek No. 1 was the fourth wildcat well drilled by Union Oil Development Corporation in the south-eastern part of the Surat Basin. The well, located approximately eight miles north-north-east of Union-Kern-A.O.G. Moonie No. 1, was drilled by Mines Administration Pty Limited for Union Oil Development Corporation to a total depth of 6126 feet. Drilling commenced on 19th May, 1962 and was completed on 8th June, 1962. A full programme of logging, testing, and coring was undertaken.

The well penetrated 118 feet of Quaternary-Tertiary sandstone and shale; 2153 feet of Lower Cretaceous Roma Formation; 1053 feet of Lower Cretaceous-Jurassic Blythesdale Formation; 1045 feet of Jurassic Walloon Formation; 639 feet of Hutton Sandstone; 540 feet of Evergreen Shale; and 352 feet of Jurassic-Triassic Precipice Sandstone. Below the unconformity at the base of the Precipice Sandstone at 5912 feet, the test entered volcanic conglomerates and siliceous sandstones of the Permo-Carboniferous Kuttung Formation in which the well bottomed at 6126 feet.

No drill stem test was carried out in the Precipice Sandstone but high resistivity on the electric log suggests freshwater saturation. A 60-minute open hole formation test was made of a sandstone interval (5240-5263 feet) within the Evergreen Shale. A net rise of 4790 feet of slightly gassy water (37 gr./gal.) was recovered on the test. In the absence of any significant shows, cement plugs were set and the well was abandoned on 10th June, 1962.

The test drilling operation at Union-Kern-A.O.G. Middle Creek No. 1 was subsidized under the Petroleum Search Subsidy Act 1959-1961, from surface to total depth.

WE LL HISTORY

General Data

Well name and number: Union-Kern-A.O.G. Middle Creek No. 1

Location:
Latitude 27° 38' 46"S.
Longitude 150° 18' 45"E.

Name and address of Tenement Holder:
Australian Oil and Gas Corporation Limited, 261 George Street, Sydney, New South Wales.

Details of Petroleum Tenement:
Authority to Prospect 57P, Queensland (approximately 47,000 square miles)

Total Depth: 6126 feet
Date drilling commenced: 19th May, 1962
Date drilling completed: 8th June, 1962
Date well abandoned: 10th June, 1962
Date rig released: 10th June, 1962

Elevation (ground): 901 feet
Elevation (top K.B.): 913 feet (datum for depths)

Status: Plugged and abandoned

Cost: £48,946

Logging and Testing

Ditch Cuttings:

Interval: Ten feet from surface to total depth.

Coring: Ten cores were cut using a Hughes "j" Type core barrel and hard formation cutter heads. A total of 115 feet was cored and 95.3 feet (83%) recovered.

Sidewall Cores: No sidewall cores were taken.

Electric and other logging (Schlumberger):

- Electrical Log: 508-6124 feet (3 runs)
- Microlog: 4500-6124 feet (2 runs)
- Sonic Log: 508-6100 feet (1 run)
- Laterolog: 4300-6121 feet (1 run)
- Continuous Dipmeter: 4200-6114 feet (1 run)

Velocity Survey: Ten horizons were tested at depths ranging from 650 to 6120 feet.

Drilling Rate, Oil, and Gas Log: Continuous drilling rate and hydrocarbon plots were recorded during drilling.

Formation Testing: Three Halliburton formation tests were carried out during the drilling operation.

GEOLOGY

Stratigraphy

General:

Union-Kern-A.O.G., Middle Creek No. 1 entered the Lower Cretaceous Roma Formation at 130 feet. The drill subsequently penetrated the Blythesdale and Walloon
Formations, the Hutton Sandstone, Evergreen Shale and the Precipice Sandstone, to an unconformity at the base of the Precipice Sandstone. Below the unconformity, the test entered the Permo-Carboniferous Kuttung Formation in which it bottomed at 6126 feet. The stratigraphic sequence encountered in the well is shown in the Table below:

Detailed:

**Quaternary-Tertiary Rocks**

The Quaternary-Tertiary rocks consist of 118 feet of coarse sandstone and lateritized shale lying unconformably on rocks of the Lower Cretaceous Roma Formation.

**Roma Formation (Lower Cretaceous):** 130 to 2283 feet (2153 feet)

Interbedded, grey, fine to coarse-grained, quartzose sandstone, grey siltstone and dark grey carbonaceous shale. Coal seams occur in the interval 615 to 915 feet.

**Blythesdale Formation (Lower Cretaceous-Jurassic):** 2283 to 3336 feet (1053 feet)

Mainly light grey, coarse-grained, quartzose sandstone with thin interbeds of grey carbonaceous shale.

**Walloon Formation (Jurassic):** 3336 to 4381 feet (1045 feet)

Interbedded grey, carbonaceous shale, siltstone and coal seams.

**Hutton Sandstone (Jurassic):** 4381 to 5020 feet (639 feet)

Interbedded, light grey, fine-grained, quartzose sandstone and siltstone with minor shale.
**Evergreen Shale (Jurassic):** 5020 to 5560 feet (540 feet)

Thinly bedded sequence of grey to brown siltstone and shale with some coal seams. Light grey, fine to coarse-grained, quartzose sandstone is present in the interval 5232 to 5262 feet.

**Precipice Sandstone (Jurassic - Triassic):** 5560 to 5912 feet (352 feet)

Mainly white to light grey, fine to very coarse-grained, quartzose sandstone.

**Kuttung Formation (Permo-Carboniferous):** 5912 to 6126 (T.D.) (214 feet +)

The interval 5912 to 6075 feet consists of white to greenish-grey, fine to coarse-grained, lithic sandstones. The interval 6075 to 6126 feet (T.D.) consists of silicified conglomerate comprising pebbles and cobbles of greenish, orange, and purple volcanic rocks.

**Structure**

The Middle Creek prospect is a south-west plunging Mesozoic fold separated by a saddle from the domal closure of the Moonie Field. The plunge of the feature is fairly gentle averaging approximately 70 feet per mile. The fold has fairly symmetrical flanks that have a dip to the north-west and south-east of approximately 320 feet per mile. This Mesozoic fold unconformably overlies a truncated and faulted sequence of rocks ranging in age from Carboniferous to Lower Triassic. The fold axis is parallel to a major north-east striking reverse fault in the underlying Palaeozoic beds.

**Oil and Gas Indications and Potential**

Cores from the Precipice Sandstone (5560 to 5912 feet), the primary target in Middle Creek No. 1 Well, were wet and showed no fluorescence, odour, stain, or cut. Porosities in the sandstone at the top of the formation (5560 to 5619 feet) range from 4.3% to 18.7% and permeabilities from 0 to 32 md. Porosities in the lower massive sandstone of the formation (5705 to 5912 feet) vary from 7.4% to 20.0% and permeabilities from 6 to 740 md.

An open hole formation test of the interval 5240 to 5263 feet recovered a net rise of 4790 feet of slightly gassy water (37 gr./gal.) from a sandstone within the Evergreen Shale. Porosities in this sandstone average 20% and permeabilities range from 557 to 1795 md.

SUMMARY OF DATA AND RESULTS
UNION-KERN-A.O.G. SOUTHWOOD NO. 1

SUMMARY OF DATA AND RESULTS*

SUMMARY

Union-Kern-A.O.G. Southwood No. 1 Well, located approximately six miles south-west of Middle Creek No. 1 and about 15 miles south of Union-Kern-A.O.G. Cabawin No. 1, was drilled by Oil Drilling and Exploration Limited for Union Oil Development Corporation to a total depth of 10,897 feet. Drilling commenced on 11th March, 1963 and was completed on 15th May, 1963. A programme of logging and coring was undertaken.

Southwood No. 1 was spudded in the Lower Cretaceous Roma Formation. The well then penetrated the Lower Cretaceous-Jurassic Blythesdale Formation at 1542 feet; the Jurassic Walloon Formation at 4065 feet; the Evergreen Shale at 5850 feet; the Jurassic-Triassic Precipice Sandstone at 6370 feet; the Triassic Cabawin Formation, unconformable beneath the Precipice Sandstone, at 6825 feet; the Permian Kianga Formation at 7375 feet; and the Permian Back Creek Formation at 7995 feet. Because of drilling difficulties the hole was abandoned at 10,897 feet in the Back Creek Formation.

The well was drilled to test the hydrocarbon potential of a closed domal structure in Permian sediments in an area approximately three miles north-west of the Moonie Field. At the location of Southwood No. 1, the "L" Horizon structure map which represents the structure on the approximate top of the Permian Kianga Formation, the producing section of Cabawin No. 1, indicates a faulted dome with 800 feet of vertical closure over an area of about 15 square miles. This closure is only one of a series of faulted domes paralleling the Moonie Field.

The Precipice Sandstone included potential reservoir beds but only a trace of blue fluorescence was noted. White fluorescence, gas shows, and oil odours were recorded from the Cabawin, Kianga, and Back Creek Formations but all three formations were impermeable. The hole was abandoned as dry.

The stratigraphic drilling operation at Union-Kern-A.O.G. Southwood No. 1 was subsidized under the Petroleum Search Subsidy Act 1959-1961, from 6400 feet to total depth.

WE LL HISTORY

General Data

Well name and number: Union-Kern-A.O.G. Southwood No. 1
Location: Latitude 27° 42' 40"S.
Longitude 150° 13' 50"E.
Name and address of Tenement Holder: Union Oil Development Corporation, and Kern County Land Company, 261 George Street, Sydney, New South Wales.

Details of Petroleum Tenement:
Total Depth: 10,897 feet
Date drilling commenced: 11th March, 1963
Date drilling completed: 15th May, 1963
Date well abandoned: 4th June, 1963
Date rig released: 4th June, 1963
Elevation (ground): 869 feet
Elevation (top K.B.): 883 feet (datum for depths)
Status: Plugged and abandoned
Cost: £170,312

Logging and Testing

Ditch Cuttings:

- Interval: Ten feet from 1400 feet to total depth.
- Coring: Eleven cores were cut using both Hughes "J" Type and D & S core barrels with hard formation and diamond cutter heads. A total of 106 feet was cored and 76.08 feet (71.7%) recovered.

Sidewall Cores: No sidewall cores were taken.

Electric and other logging (Schlumberger):

- Induction - Electrical Log: 1287 - 10085 feet (3 runs)
- Microlog: 5650 - 7777 feet (2 runs)
- Sonic Log: 1287 - 10075 feet (2 runs)

Velocity Survey: Twelve horizons were tested at depths ranging from 1572 to 8670 feet.

Drilling Rate, Oil, and Gas Log: Continuous drilling rate and hydrocarbon plots were recorded during drilling.

Formation Testing: None.

GEOLOGY

Stratigraphy

General:

Union-Kern-A.0.G. Southwood No. 1 was spudded in the Lower Cretaceous Roma Formation. The well then penetrated the Blythesdale and Walloon Formations, the Hutton Sandstone, Evergreen Shale, and the Precipice Sandstone to an unconformity at the base of the Precipice Sandstone. Below the unconformity, the well drilled 550 feet of the Triassic Cabawin Formation, 620 feet of the Permian Kianga Formation, and 2902 feet of the underlying Permian Back Creek Formation, in which the well was bottomed at 10,897 feet. Logging of the well commenced at 1300 feet.

Detailed:

**Roma Formation (Lower Cretaceous):** 1300 to 1542 feet (242 feet +)

Interbedded, shallow water marine siltstone, sandstone, and shale with minor traces of coal. The siltstone and shale are grey, soft, and carbonaceous.

**Blythesdale Formation (Lower Cretaceous-Jurassic):** 1542 to 4065 feet (2523 feet)

From 1542 to 2858 feet, the sequence is transitional from the Roma Formation to a predominantly arenaceous section. The latter, from 2858 to 3415 feet, consists of coarse-grained, porous, quartzose sandstone. The lowest part of the formation, from 3415 to 4065 feet, consists of interbedded grey to brown, tuffaceous, carbonaceous shale and fine to medium-grained, light grey, quartzose sandstone.

**Walloon Formation (Jurassic):** 4065 to 5118 feet (1053 feet)

A fresh water sequence of siltstone, shale, and coal, with traces of sandstone. The siltstone and shale are light to dark brown, and carbonaceous.

**Hutton Sandstone (Jurassic):** 5118 to 5850 feet (732 feet)

Light grey, fine to coarse-grained, quartzose porous sandstone with interbedded siltstone and shale.

**Evergreen Shale (Jurassic):** 5850 to 6370 feet (520 feet)

Interbedded, tan to grey, carbonaceous siltstone, and dark grey to dark brown, carbonaceous shale with minor light grey to green, fine to medium-grained, quartzose sandstone intercalations.
Precipice Sandstone (Jurassic-Triassic): 6370 to 6825 feet (455 feet)

Quartzose, grey to green, porous, permeable sandstone with shale and siltstone in the upper part and 50 feet of conglomerate at the base.

Cabawin Formation (Triassic): 6825 to 7375 feet (550 feet)

Green and grey-green, tuffaceous, granule-pebble conglomerate and conglomeratic sandstone with minor interbeds of reddish-brown siltstone and shale.

Kanga Formation (Permian): 7375 to 7995 feet (620 feet)

Interbedded coal and tuff with minor tuffaceous sandstone, siltstone, and shale. The contact with the underlying Back Creek Formation is gradational.

Back Creek Formation (Permian): 7995 to 10,897 feet (2902 feet +)

Marine siltstone and shale with minor tuffaceous sandstone and conglomerate. Coal seams occur in the upper part of the sequence. Marine fossils are abundant throughout.

Structure

The structure is a faulted dome, located by seismic survey, having a vertical closure of 800 feet over an area of about 15 square miles in Permian sediments. These sediments occur in a complexly faulted belt to the north-west of the Moonie Field.

Oil and Gas Indications and Potential

No significant shows were logged in the section above the Cabawin Formation, except for a trace of blue fluorescence at the top of the major sandstone development of the Precipice Sandstone. Porosities in a portion of the upper sandstone unit of the Precipice between 6403 - 6432 feet ranged from 5.3% to 18.6% and permeabilities from 0 to 225 md; porosities in the top of the major Precipice sandstone development between 6521 - 6541 feet ranged from 7.5% to 20.1% and permeabilities from 0 to 219 md. Microlog indicated that the best continuous reservoir section in the Precipice Sandstone was between 6626 - 6764 feet.

Although traces of white fluorescence and methane gas shows were recorded in the Cabawin Formation, the sandstones and conglomerates of the formation are impermeable and show no reservoir potential.

The Permian Kanga and Back Creek Formations were the major targets of the Southwood test. Methane gas and traces to strong shows of bluish-white fluorescence were logged throughout the Kanga; however, the entire section was impermeable. Cores within the Back Creek Formation bled traces of gas and had a fleeting oil odour on fresh breaks. There were traces of white fluorescence and methane gas shows with traces of heavier hydrocarbon in the formation; however, as with the Kanga, the Back Creek Formation was impermeable with no reservoir potential.
